What’s the purpose of the analysis?

Goal

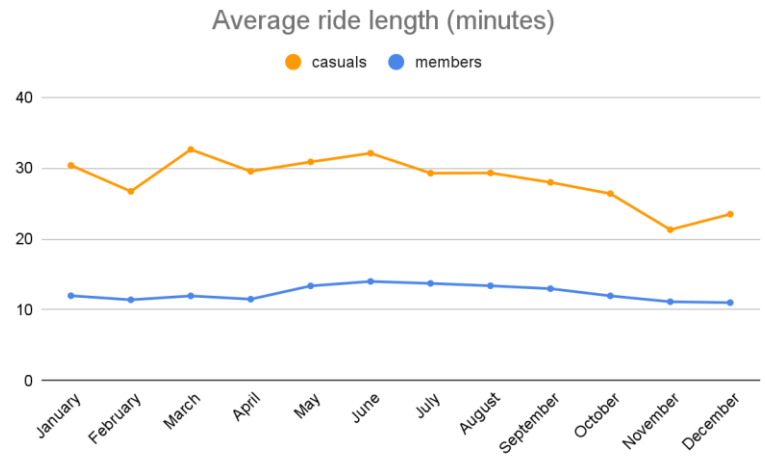
Identify how **members** and **casuals** differ in the way they use **Cyclistics** service through the analysis of the company's last twelve months of historical data.

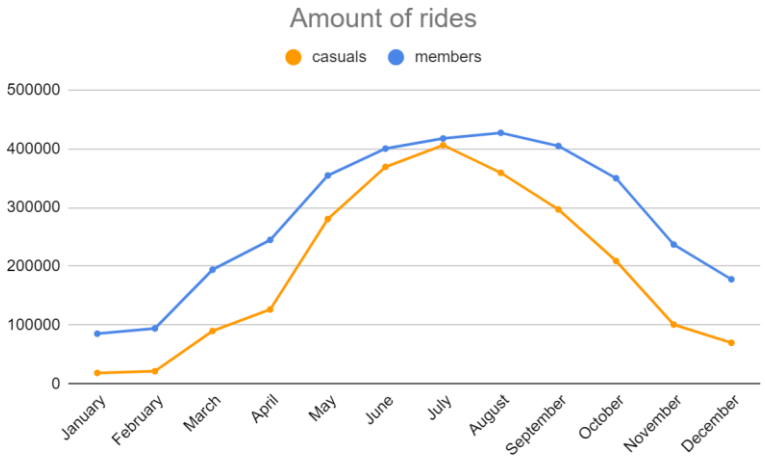
What’s the data telling?

Monthly

- Casuals' ride length is **twice** to **three times** as long as members' rides.

- Members' rides are more **spread out** while casuals' rides appear to be **concentrated** within may to september.

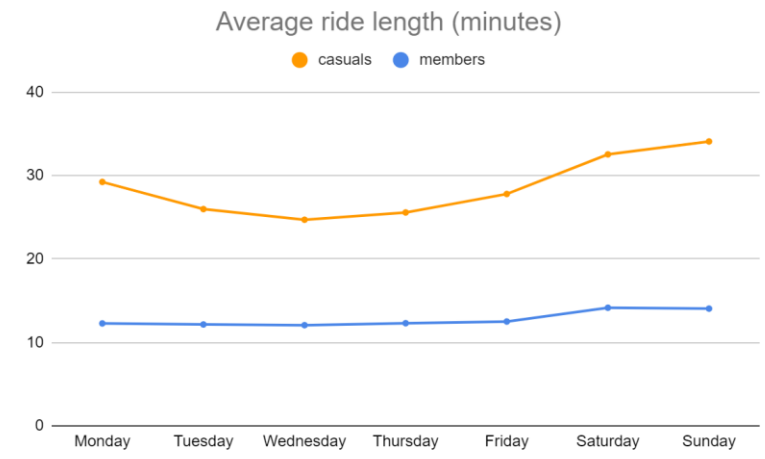


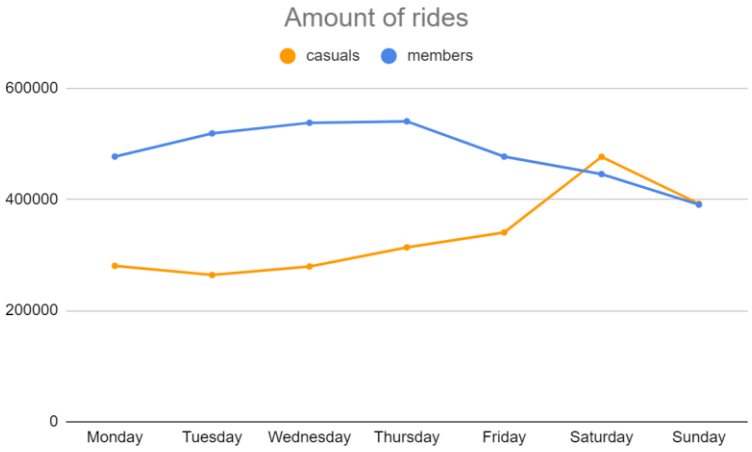


Weekly

- Casuals' ride length is **twice** to **three times** as long as members' rides.

- Members' rides appear to be almost **double** compared to casuals' during **weekdays**. However, casuals' rides are **slightly** more than members' during **weekends.**

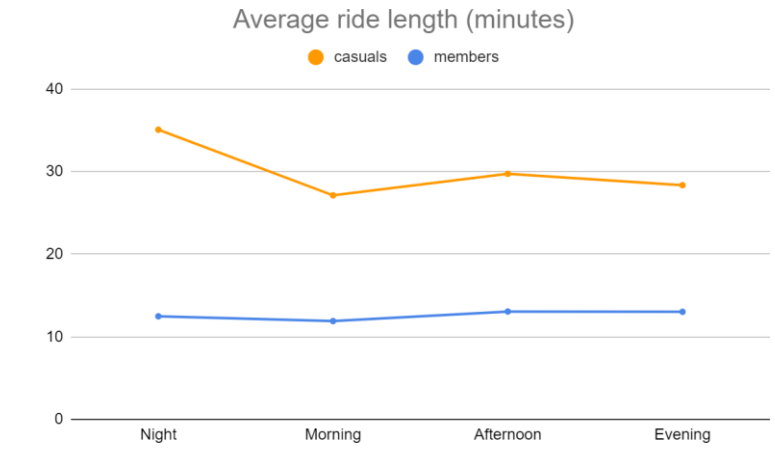


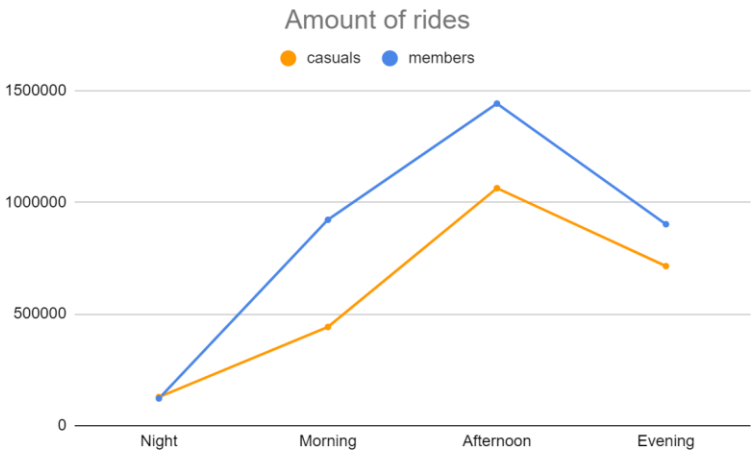


Daily

- Casuals' ride length is **twice** to **three times** as long as members' rides.

- The difference between the amount of rides of members and casuals is the **biggest** during the morning (6-12).





Conclusions

What to take away

Casuals' rides appear to increase during weekends and summer in contrast with **members** whose rides are more during the weekdays and the rest of the year.

Casuals' ride length is bigger compared to **members'**.

Casuals and **members** profiles appear to be definitely different.

Further analysis could take place with the help of surveys to better understand the behavior of **casuals** in order to create an offer that suits their needs the best.
